

What I Can Make Happen

Pair practice; individual evidence. Use the paper symbol and sewing activities.

Name: _____

Date: _____

How to use this passport

Record what you actually did. Label observed, simulated, or deferred work. Both partners practice; each explains her own contribution.

1. Paper future symbol - wood stitching deferred

☐ Paper design ☐ Meaning explained ☐ Wood stitching deferred

My future statement

Complete: In the future, I will use my ideas to...

One design choice I made

Shape, word, symbol, size, or placement.

Evidence I can point to

Draw your paper symbol and explain its colors. Save a photo or digital sketch.

2. Circuit Lab - a complete path makes light

☐ Practice sewn ☐ Powered test passed ☐ Powered test deferred

Draw the path

Show battery + and -, separate conductive-thread paths, and sewable LED polarity.

What changed when I tested?

My contribution: _____. What I tested or observed: _____. One change: _____.

Quick safety check

Battery removed while sewing; mentor inspected both sides before power. Record only checks actually completed. Return and count needles.

Inputs, Code, and Light Patterns

Use the W micro:bit. NeoPixels are an observed preview; physical testing is deferred.

Name: _____

Date: _____

3. micro:bit - an input can trigger a response

☐ Physical board ☐ Simulator only ☐ Change + retest

I did...	The micro:bit did...	The block/code that caused it was...
A / B / A+B clear		
Changed one block or value		

My IF / THEN explanation

IF I ____, THEN _____. Three A/B/A+B trials: ____ / ____ / _____. After my change: _____.

4. Observed NeoPixel preview - physical test deferred

☐ Video observed ☐ Diagram/code observed ☐ Physical test deferred

Pattern I observed	A change I would try	What I noticed / predict
Color / brightness / number / order / timing		
My proposed A / B / A+B off effects		

Carry forward

Star one capability you may use in a project: visible symbol / sewn circuit / physical input / programmed light pattern. Be ready to tell a mentor why.

Three Fast Ideas, Then Combine

Sketch to think. These are possibilities, not promises or polished art.

Name: _____

Date: _____

Future statement or message

What do you want someone to notice, feel, understand, or do?

Make three noticeably different possibilities

1

It responds when...

2

It responds when...

3

It responds when...

Circle one idea - or combine parts

I am choosing idea(s) _____ because the technology helps the message by...

Capability I might use	What it would do for the person wearing or viewing it
Paper symbol / circuit / micro:bit / NeoPixel idea	
A second capability, if useful	

Studio rule

A smaller idea that works safely is stronger than a crowded idea that cannot be tested.

Map the Wearable Before Building

Use simple labels and arrows. Your mentor conversation matters more than drawing skill.

Name: _____

Date: _____

Placement map

Shirt - front, back, and circuit

Label art, LED positions, separate paths, and battery location. Add a back-view inset.

Bucket hat - outside and inside

Label pixel path, controls, removable electronics, and balanced battery pockets.

When this happens...	The wearable will...	So the audience understands/feels...
A / B / A+B off; shirt switch	Light, symbol, pattern, or other output	

First prototype question

Name the smallest test, including any deferred hardware. Owner / next school-time check: ____.

Mentor conversation - not a score	Circle or note
I can explain the message and what the technology does.	clear / talk again
My placement protects comfort, movement, and battery access.	safe start / revise
First test / decision: Approved, Revise, or Technical Review.	status + next action
